TEXT:
 Verity's IntelliServ 1.0 manages mounds of information with cutting-edge
search power
    Building on its search engine expertise, Verity Inc.'s new IntelliServ
1.0 is an intriguing tool to combat corporate information overload.

Designed for corporate intranet use, IntelliServ combines message bulletin-board capability, push prowess and search engine power to track, index and serve up just the information a user desires via Web browsers, E-mail accounts, scrolling tickers and alphanumeric pagers. In the process, IntelliServ hopes to be your one-stop shop for messaging, information and corporate interaction.

IntelliServ indexes information from diverse sources, including Web sites (both internal and external), local directories and servers, POP3 (Post Office Protocol) mailboxes, ODBC databases and Microsoft Exchange servers.

At $4,995 for five users, IntelliServ hardly falls into the "impulse-buy" category and in testing clearly bore the marks of a 1.0 release. Nevertheless, its potential as an intranet information tool warrants close study, and IS departments should by all means download a trial version from Verity's Web site (www.verity.com).

Before hitting the download button, take note: IntelliServ demands Windows NT 4.0 Server running Service Pack 3 and IIS (Internet Information Server) 3.0 with ASP (Active Server Pages). An individual server can handle from 500 to 1,000 users depending on usage. Verity plans a version for Netscape Communication's Enterprise Server later this year. It's also investigating other Web server platforms, but for now it's strictly Microsoft's IIS 3. Committed to NT, IntelliServ takes advantage of NT's features where possible, tying into the performance monitor, event viewer and other Win32 services.

For a product of IntelliServ's breadth and power, installation is extremely simple, taking all of 30 minutes from the moment you pop in the CD, to the point where you're defining users and data sources--the heart of IntelliServ's info power. IntelliServ's ease of installation and management is sure to be welcomed by harried IS personnel all too familiar with cracking open thick manuals for even simple installations, followed by days of testing and tuning.

But this ease of setup exacts a small price. IntelliServ offers less customization than similar products such as Netscape's CompassServer 3.0, and you can't graphically fine-tune IntelliServ to match your corporate look and feel. You can add your company logo, name and intranet links, however, and Verity plans a customization kit later this year to address these concerns.

Interacting with IntelliServ is purely Web-based, both on the administrative and user sides. Remote users need only Web access to tap into IntelliServ information; drawing on Web operation opens IntelliServ's power to any platform with a Web browser. Still, considering IntelliServ's joined-at-the-hip relationship with NT, Verity should consider adding native Windows applications for admin functions to bolster its existing Web admin ability, smoothing user and local data sources management.

For example, IntelliServ manually adds users in one of three ways: importing a CSV (comma-delimited file), or synchronizing with existing NT Domain or server-user lists. However, synching with a server's user list is an all or nothing event. IntelliServ imports all **NTusers** , including **pseudo**accounts such as those for anonymous ftp, maintenance, etc., which then need to be manually deleted. A simple window, or even Java dialog box, to provide selective import would help. Later synchronization automatically removes users not listed in the CSV file, domain or server user list.

Administrators can avoid manually adding users by enabling IntelliServ's Web Service Authentication. With Web authentication active, users never see the standard IntelliServ log-in screen. Rather, they log-in via Web authentication creating their account in the process, which an administrator can later add to groups and further manage.

Verity keeps it simple on the management side, splitting admin functions into five main categories: managing users, groups, data sources, queries and options. To speed data source additions, IntelliServ includes a special wizard. You can also cut to the heart of the matter once you're familiar with adding directories (by typing in the Universal Naming Convention locations), Verity collections, Web sites or POP3 E-mail boxes to the available list of data sources.

Each data source can be scanned for updates at definable intervals, and they can be shared among selected**user**groups.

The Tapping Options define interaction with**proxy**and mail☐servers☐ for optional query updates, either via console notifications or E-mail. In an effort to keep tabs on query scans and notifications, IntelliServ maintains two log files in the winnt system32 logfiles directory.

In the 1.0 release, defining a POP3 account as a data source is less a benefit than it could be, since IntelliServ reads all the messages at user-defined intervals and then deletes them from the mail server--a habit Verity says will be rectified by adding an option to leave messages on the server in the upcoming 1.1 release. As is, this read-and-dump practice limits using E-mail data sources to common E-mail accounts (i.e., info@company.com) that are otherwise annoying to check.

Users may find IntelliServ initially confusing, but should quickly grasp the distinction among personal pages, queries, searches and the message board after a few passes through IntelliServ's well-done onscreen help. At first log-in users receive a main personal page containing a navigation and control bar down the browser's left side. Here's where IntelliServ's power meets the pavement by sharing and consolidating information.

In performing info herding IntelliServ offers two main approaches: an instant search to buzz saw through all data sources available to your user group and queries, which can be extremely detailed, confined to specific data sources and narrowed with basic Boolean operators. Queries can be saved, attached to personal pages or shared. And query results can appear in a floating, scrolling ticker window.

Can't get to a Web browser? That's no problem--IntelliServ can automatically send query results whenever new documents are found, or at scheduled times to E-mail accounts, either your company's internal E-mail account or another address. What's more, query results can be sent to alphanumeric pagers.

To share notes among groups, users can post messages to the IntelliServ bulletin board, or send the messages from IntelliServ via POP3 E-mail to the same groups. There's no limit on message length, which can contain HTML formatting, as well as an expiration date past which IntelliServ deletes it from the board. The expiration date doesn't affect messages sent via POP3.

Certainly handy, IntelliServ's messaging poses little threat to stand-alone products such as O'Reilly's WebBoard, which includes threading, Java-based real-time chats and attachment capabilities. IntelliServ's message board is basically a scrolling message list arranged by post date, sans threading capabilities, but does add to IntelliServ's ability to keep valuable information in one place.

Overall, IntelliServ delivers on its promise to bring a semblance of control over the countless pieces of data that bombard us each day. Though still bearing the marks of an early release, IntelliServ is nevertheless a valuable addition to intranets currently lacking a coherent information management system.

IntelliServ 1.0, Verity Inc., 894 Ross Drive, Sunnyvale, Calif. 94089; 408-541-1500; www.verity.com; pricing: $4,995 for five users; user pack licenses: 25 for $2,995; 100 for $9,995.
